

Master HTML Tag Reference

1. Heading Tags (Hierarchy)

Used to organize content by importance.

- **<h1>**: The main page title. (e.g., *Patient Portal*)
- **<h2>**: Major section titles. (e.g., *Registration*)
- **<h3>**: Sub-section titles. (e.g., *Security Settings*)
- **<h4>**: Minor headers for grouping. (e.g., *Password Rules*)
- **<h5>**: Small sub-grouping headers.
- **<h6>**: The smallest structural header level.

2. Structural Tags (Layout)

The "containers" that hold your site together.

- **<html>**: The root container for the entire web page.
- **<head>**: Holds metadata, page title, and CSS links (invisible to users).
- **<body>**: Holds all visible content (text, images, forms).
- **<header>**: The top area for logos and navigation menus.
- **<main>**: Wraps the unique, central content of the page.
- **<section>**: Groups related content (e.g., a "Contact Us" section).
- **<footer>**: The bottom area for copyright and privacy links.
- **<div>**: A generic block container used for layout and styling.

3. Content & Text Tags (Information)

The elements used to display your health data and descriptions.

- **<p>**: A paragraph for standard body text.
- **<a>**: An anchor tag used to create hyperlinks (`href="url"`).
- ****: An unordered (bulleted) list.
- ****: An ordered (numbered) list.
- ****: An individual item inside a list.
- ****: Embeds an image (requires `src` and `alt` attributes).
- ****: An inline container for styling specific words or small icons.
- **<small>**: Used for fine print, like legal disclaimers or error messages.

4. Form Tags (Interaction)

The "Smart" elements for your signup form.

- **<form>**: The wrapper that captures and sends user data.
- **<label>**: A text label for an input; improves accessibility.
- **<input>**: The primary data entry field (Type: email, password, text).
- **<textarea>**: A large, multi-line box for notes or medical history.
- **<button>**: A clickable element to submit the form or trigger actions.
- **<fieldset>**: A box that groups related form fields (e.g., *Emergency Contact*).

• Advanced Structural & Semantic Tags

- These tags help search engines and assistive technologies (like screen readers) understand the **meaning** of your layout.

Tag	Description
<article>	Represents a self-contained composition (e.g., a medical blog post or a specific health tip).
<aside>	Content indirectly related to the main text, often used for sidebars or "Did you know?" health facts.
<nav>	Defines a block of navigation links (e.g., Home, Find a Doctor, Patient Portal).
<figure>	Used to group media (like an X-ray image) with a caption.
<figcaption>	Provides the text description for a <figure>.
<details>	Creates an interactive "accordion" that the user can click to open.
<summary>	The visible heading for the <details> element.

• 2. Professional Form & Interactive Tags

- For a "Smart" signup, these tags provide better data structure and user experience.

Tag	Description
<datalist>	Provides an "autocomplete" list for input fields (e.g., a list of blood types or insurance providers).
<optgroup>	Groups related options inside a dropdown menu (e.g., grouping doctors by "Cardiology" vs "Pediatrics").
<select>	Creates a dropdown list for choosing a single or multiple options.
<option>	Defines the individual items inside a <select> or <datalist>.
<progress>	Displays a progress bar (useful for showing how far a user is in a multi-step signup).
<output>	Used to display the result of a calculation (e.g., a BMI calculator on a health site).

• 3. Text Formatting & Media Tags

- These tags provide nuance to your content and handle external assets.

Tag	Description
<code>	Displays computer code or technical data in a monospaced font.
<time>	Represents a specific date or time (e.g., appointment times), making it machine-readable.
<mark>	Highlights text, usually used to show relevant terms in a search result.
<cite>	Used to reference the title of a work (e.g., a medical study or a journal article).
<video>	Embeds video content directly (e.g., a "How to use this portal" tutorial).
<audio>	Embeds sound files (e.g., audio versions of health articles for accessibility).
<iframe>	Embeds another document (e.g., a Google Map showing the hospital's location).

• 4. Metadata & Hidden Tags

- These live inside the <head> and control how your site behaves behind the scenes.

Tag	Description
<title>	Sets the name of the tab in your browser.
<meta>	Provides metadata like keywords, description, and viewport settings for mobile responsiveness.
<link>	Connects the HTML file to external resources like CSS stylesheets or Google Fonts.
<script>	Links to or contains JavaScript code (the "Brain" of your signup form).
<style>	Allows you to write CSS code directly inside the HTML file.
